

A scaffolding solution without rocket science

Håndværk | 21.04.16 | 14:55 - Kim Ebbesen

The new Spacefiller from Nordic Platform reaps international interest and Danish recognition.

The scaffolding supplier Nordic Platform, has become internationally known for their composite platform. The product was originally developed for the Danish market, but it is the foreign markets, which have seriously considered the product for themselves. Here, the interest is significant and at the recently finished Bauma exhibition in Munich - the Danish stand attracted much attention!

At the exhibition, Nordic Platform also had a new product in the form of Spacefiller. It is quite basic a rail made of polypropylene, which is a synthetic fiber. The rail is specially designed to close the gap that occurs between the scaffolding platforms. There are already other brands and models on the market, but the Spacefiller seriously challenges its competitors, because of the very low weight combined with the high strength.

- It may seem like a very small thing, but in our industry is huge. The Spacefiller weighs one kilogram per meter and is the easiest 'transition piece' available on the market, and has already generated considerable international interest says Per Moses Jakobsen, Managing. Director of Nordic Platform.

The rails is being dispatched in a length of 6 meters and then it is up to the customer to cut them into the desired lengths. This is easily done with a standard handsaw. The holes are rapidly carried out - with a 10 mm drill - for the corresponding straps that secure the Spacefiller to the scaffold.

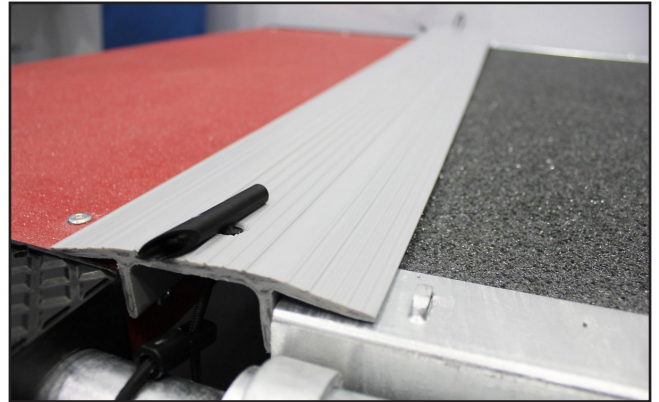

Very simple

During the exhibition, a group of members came from the Danish Scaffolding Club at the stand, and in contrast to many other guests - but exactly in the product spirit - they took hold of products and handled them as if they were on a building site. The judgment is not to be mistaken.

- It's easy, it's simple and it works. It is not rocket science, but neither should it be, says Thomas Strømsholt, Board member of the Danish Scaffolding Club.

He has noted that there is a similar system on the market already, but it requires handling of multiple linkages and it is not convenient, he said.

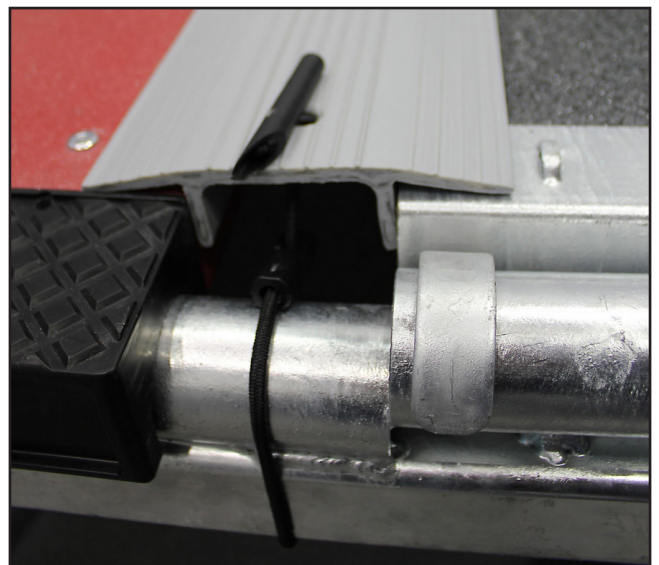

- At the same time the Spacefiller can be cut as you like. It cannot be much simpler. And it's nice that you have a manufacturer who listens to the challenges the scaffold workers are faced with, and would like to enter a dialogue about the solutions, says Thomas Strømsholt.
